

**WEIGHTED DECISION MAKING SYSTEMS, METHODS
AND COMPUTER PROGRAM PRODUCTS**

Abstract of the Disclosure

Weighted decision making systems, methods and computer program products assist a user to select a choice from multiple choices, by displaying to the user a set of criteria that pertain to the multiple choices, accepting user selection of at least a subset of the criteria, and accepting user input of weights for the criteria that were selected. User input of a numeric rating for the criteria that were selected is also accepted, for each of the multiple choices. A score is calculated for each choice by summing the products of the numeric rating and the weight for the criteria that were selected. At least one of the choices is then displayed based on the scores that were calculated.
